# CHAMBERS'S SEVEN-FIGURE MATHEMATICAL TABLES

CONSISTING OF LOGARITHMS OF NUMBERS 1 TO 100,000 TRIGONOMETRICAL AND OTHER TABLES

COMPILED BY

JAMES PRYDE, F.E.I.S.

COLLEGE EDITION

W. & R. CHAMBERS LTD.

6 DEAN STREET, LONDON, W.1

11 THISTLE ST., EDINBURGH, 2

#### FOREWORD

Thus College Edition of Chamber's Seten-Figure Mathematical Tables by James Fry de has been abbreviated from the original by the omission of a number of specialised tables contained in the original. All the tables used in ordinary calculations have been retained, a short table of functions of the integers 1-100 has been added, and the final page of mathematical constants and metric conversion factors has been presented in a more convenient form.

## EXPLANATION OF THE TABLES.

## COMMON LOGARITHMS. (Pages 2-181.)

(1) A Table of Logarithms is a collection of auxiliary numbers, so constructed, that by it Multiplication of common numbers can be performed by addition of their Logarithms; Division by their subtraction; Involution, or raising of powers, by their multiplication; and Evolution, or extraction of roots, by their division. These auxiliaries or Logarithms are the exponents or powers to which an invariable number called the base has to be raised, in order to produce the number of which it is the Logarithm.

The above expressed in algebraic symbols, where  $\Lambda$  and B represent two numbers, is

(c) Log. 
$$(A \times B)$$
 = log.  $A + log. B$ .  
(b) Log.  $\frac{A}{B}$  = log.  $A - log. B$ .  
(c) Log.  $A^n$  =  $n log. A$ .  
(d) Log.  $\sqrt[n]{A} = Log. A^{\frac{1}{n}}$  =  $\frac{1}{n} log. A$ .

(2) In the following Tables of common logarithms, the base = 10, and the power to which 10 has to be raised to produce any number, is therefore the logarithm of that number; thus,

If, beginning again with 101, we divide successively by 10, we obtain the following results:

When we find from the Table that  $\log 25 = 15440680$ , this means that  $10^{10.01018} \approx 10^{1118111} = 35$ , or that, If 10 be raise it is a power denoted by the numerator of the fractional exponent, and of the number as found the root indicated by the denominator be extracted, the result will be 85 Other locarithms are to be annularly interpreted.

(3) From the above it appears that the common Log 1 = 0, that Log 10 = 1, hence, the logarithms of numbers greater than 1 and less than 10, will be greater than 0 and less than 1, in other words, will be some proper fraction or declenal, without an integer, that the logarithms of all numbers greater than 10 but less than 100, will be greater than 1 and less than 2, or will be 1 + a declenal, while the logarithm of a number consisting of 3 integral figures will be 2 + a decimal, while the logarithm is the integral part of the logarithm being always one less than the number of integral figures in the number of which it is the logarithm.

(a) Definition.—The obegrel part of a logarithm is called its characteristic, and the decimal part is called the mantess:

(4) It also appears that the logarithms of all proper fractions are negative, thus, the logarithm of 2 or log 75 in (1, b) log. 3-log 4, sr 477:1213 - CO2000 - 129937, but subtracting this from 0, the logarithm of 1, we have 1 570013, where the characteristic only is negative, and the mantises in protive, and consists of the same figures as the mantess of log 70, which is 1 8750617, from which it appears that the mantess of the logarithm of a number is the same, so long as the dugts of the number remain the same, and that the characteristic alone changes according to the position of the dominal point, thus.

Log 43758 - 4 G410578 Lout 4375 8 = 3 6410575 Log 437 58 = 2 C410575 Log 43 758 = 1 6410575 Log 4 3758 = 0.6110575 Log 48758 = T 6410575 Log '013758 = 5441057E Log 0048758 = \$ 6410578 éc. 23

- (a) This property of the characteristic and mustices as only true of logarithms whose here is the same as the tool of the scale of antimetical notation, if is not true of Naprian logarithms, hence, a table of Naprian logarithms, in order to be universally useful, would require to be infinite in extent. For this reason a table of common logarithms is commonly used for ordinary processes of calculation.
- (5) The Characteristic.—From what has been said above, and from the fact that only the mantissa of the logarithm is put in the Table, the characteristic, in each case, must be supplied by the calculator lumself. This is done by the following easy Rules.

- (a) If the number whose logarithm is sought contain one or more integral figures, the characteristic is always one less than the number of integral figures in the number, and is positive.
- (b) If the number is wholly a decimal, its characteristic is the same as the place from the decimal point which its first significant figure occupies, and is negative: in this case the negative sign is placed over the characteristic, to show that it alone is negative, the mantissa being always positive.
  - (6) TO FIND THE LOGARITHM OF A GIVEN NUMBER BY THE TABLES.
- (a) If the number consist of not more than three figures: the mantissa will be found in the tables, opposite the number multiplied by 10, 10², 10², etc.; and the characteristic must be supplied by (5, a) or (5, b), according as it contains an integer, or is all a decimal. In this manner are found Log. 7, Log. 75, Log. 753, and Log. .0075:

Mantissa of Log.  $(7 \times 10^3) = .8450980$   $\therefore$  Log. 7 = 0.8450980 Mantissa of Log.  $(75 \times 10^3) = .8750613$   $\therefore$  Log. 75 = 1.8750613 Mantissa of Log.  $(753 \times 10) = .8767950$   $\therefore$  Log. 753 = 2.8767950 Mantissa of Log.  $(0.0075 \times 10^6) = .8750613$   $\therefore$  Log.  $0.0075 = \overline{3}.8750613$ 

(b) If the number contain four digits: the mantissa will be found on pages 2 to 181 under 0 at the top of the page, and opposite the number itself in the column marked No. at the left-hand side of the page; and the proper characteristic must be applied as in the last case. In this manner are found,

Log. 374.5 = 2.5734518 Log.  $.03745 = \overline{2}.5734518$ 

(c) If the number contain fire digits: the mantissa will be found on pages 2 to 181, opposite the first four figures on the left-hand side of the page, and under the fifth at the top. In this way it is found that

Log. 87617 = 4.9427371 Log.  $.78539 = \overline{1}.8950854$ 

(d) If the number whose logarithm is sought contain six or seven figures: find the mantissa corresponding to the first five figures as directed in (c); then take the difference between this logarithm and the next higher in the table, which is the change in the logarithm corresponding to an increase of I or a unit in the fifth figure of the number. Now, the sixth figure is tenth parts of this unit, and the sixth and seventh are hundredth parts of this unit; in other words, are decimals in reference to it. Hence, if the difference found above be multiplied by the figures above five, considered as decimals, and the product added to the logarithm found as above, it will be the true logarithm sought; thus: Find the logarithm of 387548.

Log. 38754 - .5883165 Log. 38765 - .5883277 their difference is 112 and 112 × .8 = 89.6 or 90 = correction ∴Log. 387548 - 5.5883255 Find the logarithm of 276 5473

The lines above the figures seen on many of the pages indicate that a change has occurred in the fret three figures of the mantissa. Thus, on page 2 line 3 the log of 100% = 4 0010411 not 4-0000411.

(7) PROPORTIONAL PARTS BY INSPECTION

These corrections can also be more radily made by means of the columns of proportional parts to be found on the right hand also of each page, thus under diff 112 and opposite 8 is found 90 which being added to the last figures of the log 38754 given log 387548 as above. Also under the difference 187 and opposite 7 is found 110 and opposite 3 is found 47, but 3 being in the secretize place 47 must be taken as 47 which being nearer to 5 than 4 must be taken as 5 and this added to the 110 given 115 as the correction to be added to the log 2766 44 oobtain the logaratim of 276 6473 obtain the logaratim of 276 6473 obtains the logaratim ob

the result being the same as found above. The differences change so rapidly at the beginning of the Tables that for want of room only every third difference as given from page 20 9 and every excend difference from page 10 to 19 from page 20 to end every difference as given. When the exact difference is not given as that which differs from it only by one and the result will be sufficiently exact for ordinary purposes but when the ordinates are considered from the difference is required.

### (8) TO FIND THE AUABER CORRESPONDING TO A GIVEN LOGARITHM

The number of which a given value is the logarithm is frequently called its Antilogarithm, and smaller tesh is usually yet for convenience a separate table of Antilogarithms. For seven figures of the mainstart tesh would be attensive it as superfluora, same the one handly to reverse the process for finding a logarithm is find from the table which number violed the curve locarithm.

When the logarithm amont fo and in the table take out the next lower and the five fluvers of the number belonging to it them, find the difference between this logarithm and the given one and under the corresponding thould be forecomed to the proportional part which is equal to this difference and opposites its found the earth figure of the number but if the difference is not exactly found amon, the proportional parts take the next lower part and the figure opposites it is the sixth figure of the number, with this part from the given difference, cancer to the remander a ciplier, consider it as a new proportional part, and find the corresponding figure as before, and it will be the seventh figure of the number.

### EXAMPLE.

Find the number (or antilogarithm) whose logarithm	n is 3·92:	12074.
Given logarithm =	3.92	12074
Number = 8340.7 to next lower log. =	3.92	12025
Number = 09 to next lower pro. part	=	49 47 20
Number = '001 to nearest pro. part	==	21
Hence 8340.794 is the required number or	antiloga	rithm.

## COMPUTATION OF NEGATIVE CHARACTERISTICS.

It is usual to make only the characteristic of a logarithm negative, as the calculations can thus be made more conveniently. Calculations with negative characteristics are made according to the rules of algebraic addition and subtraction.

(9) (a) To add two negative characteristics.

Take their sum, and make it negative. Thus 2 added to 3, gives 3.

(b) To add a positive and negative characteristic.

Take their difference, and consider it to be positive or negative according as the positive or negative characteristic is the greater; that is, the difference has the sign of the greater.

Thus 6 and  $\overline{2}$  give 4; 5 and  $\overline{2}$  give 3;  $\overline{5}$  and 2 give  $\overline{3}$ ;  $\overline{2}$  and 1 give  $\overline{1}$ ; and so on.

The following examples will easily be performed by attending to these two rules:

### EXAMPLES.

1. Add 5-3468541 and 3-2685427
5-3468541
3-2685427
2-6158968
2. Add 6-3874654 and 2-9245630
6-3874654
2-9245636
5-3120290

In this example the sum in the first decimal place is 13, and the 1 is carried to 3 which gives 7, then 7 and  $\bar{2}$  give 6.

#### (10) To subtract a negative characteristic

Change its sign to plus, and then add is by the preceding rules for addition. Thus, to subtract \$ from 2, the result is found by adding \$ to 2, which gives \$. \$6 \$ 5 subtracted from 2, gives \$ and 2, or \$8, also \$ subtracted from 5, gives \$ and \$2, or \$.

EXAMPLES.

1 From 2 6847658 abstract 2 2488543
2 684768
3 2468543
5 4379115

2. From 28468587 subtract 5 7654626

2 3468537 B 7654626

Here 5 taken from 2, gives 5 and 2, or 2, but in subtracting the first decimal places, there is one to be carried, in other words, I is to be subtracted from the upper number 2, which makes it 3, then 3 and 5 give 2

From E 6843252 aubtract 3 7856310

\$ 6843252 \$ 7856310

Here 3 taken from 5, gives 3 and 5 or 2, and a 1 of carriaga which is of course to be subtracted, gives 2 and 1 or 3, or the 1 of carriage, with the 5 makes 5, and 3 taken from 5, gives 3 and 6 or 3

(11) To multiply a logarithm with a negative characteristic.

Multiply the fractional part by the common rules, then multiply the negative characteristic, which will give a negative product, and add the carriage to it by the rule (5) above.

Thus Z, multiplied by 5, gives 16, and if 2 of carriage is to be added, the result is X

#### EXAMPLES.

1. Multiply 2 2685464 by 2 2 3685464

7 7870928

2. Multiply \$ 7856473 by 6 \$ 7856473

T4-7188838

Here 3 x 6 = IB, and IB, with the carriage 4, gives T4.

## (12) To divide a logarithm having a negative characteristic.

If the characteristic is divisible by the divisor, write down the quotient with a negative zign, and divide the fractional part by common rules. But if the negative characteristic is not divisible by the divisor, add such a negative number to it as will make it divisible, and prefix an equal positive integer to the fractional part of the logarithm; then divide the increased negative exponent and the other part of the logarithm separately, and the former quotient, taken negatively, will be the characteristic to the fractional part of the quotient.

Thus  $\overline{c}$ , divided by 8, gives  $\overline{2}$ . But to divide  $\overline{10}$  by 8, add  $\overline{2}$  to it, and then  $\overline{10}$  is equal to  $\overline{12}$  and 2; the former, divided by 3, gives  $\overline{4}$ , and the latter  $\frac{2}{5}$ . The quotient, therefore, is  $\overline{4}$  and  $\overline{4}$ .

### EXAMPLES.

1. Divido

 $\overline{6}$ :S246846 by 8  $\overline{6}$ :8246846  $\div$  8 =  $\overline{2}$ :1082282

2. Divido

 $\overline{14}$ ·8268472 by 9  $\overline{14}$ ·8268472 =  $\overline{18}$  + 4·3268472

and the quotient is

= 2.4807608

Here 4 must be added to  $\overline{14}$ , that the sum  $\overline{18}$  may be divisible by 9; and as  $\overline{4}$  is thus added, therefore 4 must be prefixed to the fractional part, and thus the value of the logarithm is unaltered, for there is added to it  $\overline{4}$  and  $\overline{4}$ , or 0.

## (13) To perform Multiplication by Logarithms.

Add the logarithms of the factors, and the sum will be the logarithm of the product.

#### EXAMPLES.

1. Multiply

2.581926 by 315.7291. L 2.581926 = 0.4119138

L 845-7291 = 2.5887859

Product = 892.617, its log.

= 2.9506797 Sum.

2. Multiply

\*03902, 59.716, and \*00314728.

 $L \cdot 03902 = \overline{2} \cdot 5912873$ 

L 59.716 = 1.7760907L  $.00314728 = \overline{5}.4979353$ 

100314728 = \$.4979353

Product = '007833538, its log.

= 3.8653133 Sum,

#### EXERCISES.

Multiply 2814 and 5.062.

2. Multiply 35.86, 2.1046, .8372, and .00294.

Ans. 1171.347. Ans. 1857618.

## (14) To PERFORM DIVISION BY LOGARITHMS.

From the legarithm of the dividend subtract that of the divisor, and the remainder will be the logarithm of the quotient.

#### EXPLANATION OF THE TABLES

FYAMPLPS

1 Divide 871 49 by 52 376 L 371 49 = 2 5039471

I

L 52 876 = 1 7191323

Quotient = 7 092752 0 8508148 Diff.

2 Divide 07438 by 129 476. L 07438 = 2 8714562 } L 129 476 = 2 1121893 }

#### RIERCISES.

1 Divide 241 63 by 4 567 Ans 52:90782 2 Divide 6314 by 907241 Ans 87:19792

#### (15) TO PERFORM PROPORTION BY LOCARITHUS

Add together the logarithms of the second and third terms, and from their sum subtract the logarithm of the first, and the remainder will be the logarithm of the fourth term

(a) The arithmetical complement of a number is the remainder, after subtracting it from a number consisting of 1, with as many ciphers annered as the number has of integers. When the index of a logarithm is less than 10, which is generally the care, its arithmetical complement is found by subtracting if from 10.

(δ) The arithmetical complement of a logarithm is easily found by subtracting its right hand significant figure from 10 and all those before it from 9

Instead of subtracting the logarithm of the first term its arithmetical complement may be added to the logarithms of the second and third, and the sum, siture deducting 10 from the index, will be it logarithm of the fourth term.

#### REASOPER.

Find a fourth proportional to 723 4 02019 and 3574 862.

As 7234 28503785 ar com. 71408218 To 07519 E4012782 24012283 So is 3874 862 2 5557992 3 5537092 1954674 T0951089

To 1244527 1 0251089

In the first method, the logarathms of the second sud third terms are added, and that of the first term is then subtracted from the sum, and in the second method, the arithmetical complement of the logarathm of the first term is added to the logarathms of the second and third, and from 9 the index 10 is subtracted, which gives I for a remander.

(c) The arithmetical complement of a number is also sometimes understood to be the algebraic remainder after subtracting the number from zero or nothing Instead of subtracting a number from another, if this arithmetical complement of the former is added to the latter, the sum will be the required difference without deducting 10 or any other number. Thus, in the above example,

A. C.\* of L 723·4 = \$\overline{3}\cdot 1406215\$ L 02519 = \$\overline{2}\cdot 4012282\$ L 8574·862 = \$\overline{3}\cdot 5532592\$ \$\overline{7}\cdot 951089\$

which is the same result - before.

## (16) TO PERFORM INVOLUTION BY LOGARITHMS.

Multiply the logarithm of the given number by the exponent of the power to which it is to be raised, and the product will be the logarithm of the required power.

EXAMPLE.

Find the cube of 30.7146.

4.4620347 = L28975.75

Hence the cube of 30.7146 = 28975.75.

### EXERCISES.

1. Find the fourth power of 9.163.

Ans. 7049:39.

2. Find the 365th power of 1.0045.

Ans. 5.148888.

## (17) To PERFORM EVOLUTION BY LOGARITHMS.

Divide the logarithm of the given number by the exponent of the root which is to be extracted, and the quotient will be the logarithm of the required root.

#### EXAMPLES.

1. Find the cube root of 12845.

L 12315 = 4.0914911= 1.8688304 = L 28.11162

Its quotient by ■ Hence

3/ 12345 = 28·11162

2. Find the fourth root of .0076542.

Hence

**∜** '0076542 = '295784

(18) To find the value of x in the equation  $a^x = b$ .

By (1, c) we have 
$$x \text{ Log. } a = \text{Log. } b$$
.  
 $\therefore x = \log_{10} b + \log_{10} a$   
Let  $a = 40$ , and  $b = 10$   
Then  $x = \frac{1.0000000}{1.6020600} = .6241964$ 

<sup>\*</sup> A. C. is a contraction for arithmetical complement.

Nort.

Then 
$$x = \frac{1 \text{ and } b = 3 1416}{\text{Log 2 1416}}$$

$$0 \text{ 4971509}$$

$$= \frac{0 \text{ 4971509}}{0 \text{ -0.09CJ100}}$$

$$= -\frac{4971509}{0 \text{ -0.09CJ100}} = -\frac{4971509}{969100}$$

= 5 130027 In this latter case = ha e to change the divisor 1-9030900 into --0959100 before the days am can be conveniently performed

(19) To find the amount and present value and a sum of money and COMPOUND INTEREST BY LOGARITHMS

Let 
$$p =$$
 the principal.

a = amount. f - " time or number of payments of interest, " interest of £1 for one period,

$$(1+r)=B=*$$
 smount of £1 for one period.

Then

Then 
$$a = p R$$
 (1)  
which by taking the logarithms of both sides become a

Log = = log p + t log R.

$$Log p = log a - t log R,$$
 (8)

$$Log R = \frac{\log a - \log p}{\ell}$$
 (4)

$$t = \frac{\log a - \log p}{\log R}$$
 (5)

(2)

Also the interest

Fransposing

$$= a - p - p \left( \mathbb{R}^{t} - 1 \right) \tag{6}$$

Note.—If in the above f rm its p = the present value of a sum a due t periods bence, they mm equally true for the present value; t, r and R being the SE ADOVE.

When a m large, the logar thm of R, in order to obtain correct results, should be taken with more than seven places of decimals for which the ite to tem to values of R, with their logarithms carried to ten decimals, are inserted

LOGARITE	MS OF B.

### EXAMPLE L

Find the amount and compound interest of £365, 10s., for 19 years at 41 per cent.

Since the rate per cent. is 4.25, the rate for £1 = r = .0425, and R = 1.0425, t = 19, and p = 365.5; then by (2),

r log. R = 19 × ·0180760636 = 0·3434452084  
+ log. p = log. 365·5 = 2·5628874  
∴ log. 
$$\blacksquare$$
 = log. 805·9954 = 2·9063326  
297  
2908 ÷ 54 = 54.

Hence the amount = £805, 19s. 11d.+

Also the interest = a - p by (6) = £805, 19s. 11d. - £365, 10s. =£440, 9s. 11d.

### EXAMPLE II.

Find the present value of £584, 15s. 6d., due 12 years hence, compound interest at 51 per cent.

Since the rate per cent, is 3.5, the rate for £1 = r = .035, and R = 1.035, t = .12, and t = .2584.775; then by (3),

Log. 
$$m = \log .584.775$$
 = 2.7669888  
-  $t \log . R = -12 \times .0149403498 = 0.1792841976$   
 $\therefore \log . p = \log .886.9943$  2.5877046024  
6997  
118)49024  
Hence  $p = £386, 198, 102d. -$  43

#### EXAMPLE III.

At what rate per cent. will £365, 10s. amount to £805, 19s. 11d. in 19 years? Here a = 805.995, p = 865.5, and n = 19; hence by (4),

Log. R = 
$$\frac{\log \pi - \log p}{t}$$
  
=  $\frac{2 \cdot 9063324 - 2 \cdot 5628874}{19}$   
=  $\frac{0 \cdot 3434450}{19}$  =  $\cdot 0180761$  nearly  
=  $\log \cdot 1 \cdot 0425 \cdot R = 1 \cdot 0425$   
r =  $\cdot 0425$ , and the rate per cent, is therefore  
=  $4 \cdot 25 = 44$ , the rate sought.

Hence

#### EXAMPLE IV.

In what time will £250 amount to £846, 11s. 91d., at 5 per cent. per annum 1 Since a = 8165885, p = 250, R = 1.05, by (5),

$$t = \frac{\log n - \log p}{\log R} = \frac{2.9276723 - 2.3979400}{0211893}$$
$$= \frac{5297323}{0211893} = 25 \text{ years, the time sought.}$$

#### DESCRIPTION OF

Find the present value of £3245 due | years hence at 41 per cent, compound Interest.

Here a = 3.245, R = 1.045, and t = 30, hence by the Note and (8).

#### EXAMPLE VL

The present value of £595 due 12 years hence, compound interest, £383 3s 41d. what is the rate per cent. per annum?

Here a = 696, p = 383 1688, t = 12, hence by the Note and (4).

p = 533 1633, t= 12, bence by the Note an  
Log R = 
$$\frac{\log a - \log p}{1}$$
  
= 27752183 - 05833902  
=  $\frac{1918570}{12}$  = 0159880  
= Log 10376 =  $\log R_1$   
•  $\frac{1}{2}$  = 10373, and the rate per cent is 38.

(20) To reside about the same varue of an about for a HILE TIME, AT A OFFEN BATE ..... COMPOUND INTEREST

Let p = the annual or periodic payment.

A = the amount of the annuity improved at compound interest to the end of the time.

m = the present value of the annuity. R = the amount of £1 for me period;

and t = the number of years, or periods of payment,

Then

$$\Delta = p\left(\frac{R^t - 1}{R - 1}\right),$$

∴ also A = zR<sup>j</sup>

and

$$e = \frac{p(\mathbb{R}^i - 1)}{\mathbb{R}^i(\mathbb{R} - 1)} = \frac{1}{\mathbb{R}^i} \Delta, \tag{8}$$

හ

Hence from (7).

lence from (7),  

$$Log A = log p + log (R^{p} - 1) - log r;$$
(10)

Log 
$$v = \log p + \log (R^t - 1) - \log r - t \log R_1$$
 (11)  
and from (9), Log  $A \Rightarrow \log v + t \log R$ 

Transposing (12),

When the change in a number is small, the change in the logarithm is very nearly proportional to the change in the number.

Log. 
$$(n+d) - \log_n n = \log_n \left(\frac{n+d}{n}\right) = \log_n \left(1 + \frac{d}{n}\right)$$
.

By the theory of logarithms, if  $\mu$  be

$$\frac{1}{\log_{10} 10} = \frac{1}{2.3025809} \text{ or } 0.43429148, \text{ Log. } _{10} \left(1 + \frac{d}{n}\right) = \mu \left(\frac{d}{n} - \frac{d^2}{2n^2} + \frac{d^3}{3n^3} - \dots \right)$$

If n be greater than 10,000, and if d be not greater than 1, the value of the second term on the right-hand side of the above equation is not greater than  $\frac{0.474}{2 \times 10^3} = .000000002$ , while the value of the third term is less than the 10,000th part of this. Therefore if a number be changed from n to n + d, the change of logarithm may be expressed as  $\frac{0.4d}{n}$ .

Thus, the logarithm of 5000 is 3.6959700, and the logarithm of 5001 is, very nearly,  $3.6959700 + \frac{1 \times 0.434}{5000} = 3.6990567$ , being nearly 2 in error in the 7th decimal place.

But there is not much gained by endeavouring to obtain logarithms to more than 7 places by extending the 7-figure logarithms given in the tables, because the 7th figure there given may be too great or too small to the extent of onehalf of unity.

In a calculation of the type  $a^m - (a+n)^m$ , where a and the index m are large, and where  $\blacksquare$  is small, if a fairly accurate result is desired, it is better to write the argument in the form  $\left\{a^{\frac{m}{2}} + (a+n)^{\frac{m}{2}}\right\} \left\{a^{\frac{m}{2}} - (a+n)^{\frac{m}{2}}\right\}$ , and evaluate it logarithmically.

#### EXAMPLE.

What is the value of 614 - 6047

Sum of antilogs. = 7321, whose logarithm = 
$$3.6645704$$
  
Difference = = 121, = =  $2.0827854$   
Hence  $61^4 - 60^4 = 885841$ , =  $5.9173558$ 

The above calculation performed in the ordinary way gives:

By ordinary arithmetic the absolutely correct result is \$85841.

#### REDUCTION OF COMMON TO NATURAL LOGARITHMS, AND THE CONVEESL. (Page 18°)

- (21) The method of using the tables will be seen from the method of using examples

## LOGAPITHMIC BINES, TANGENTS, AND SECANTS, (PAGES 183 227)

The logarithmic sines, tangents, &c. | iiii the logarithme of the numbers that express the lengths of these lines for any given are, surfacing the radius of the circle to be 10,000,000,000.

- (22) To find me locarithms me of me arc.
- (a) When the me contains degrees and minutes only

If the number of degrees exceeds 45, and \$\extstyle{1}\$ less than 90, they will be found \$\extstyle{1}\$ the foot of the page, and in the column marked sure at the foot, and opposite \$\extstyle{1}\$ the number of mhautes \$\extstyle{1}\$ the right-hand column, will be found the required logarithm

The rule applies to tangents, cotangents, and all the other trigonometrical quantities.

### EXAMPLES.

The	log.	sine of	36° 2	4' i	s 9·7783614
		secant	36° 5	0′ "	10.0967023
		cotangent	53° 3	6′ •	9-8676228
20"		tangent	53° 4	0′ "	10.1334356

(b) When the arc contains degrees, minutes, and seconds.

Find the logarithm for the number of degrees and minutes as before, and multiply the tabular difference in the difference column next this logarithm by the number of seconds; divide the product by 60, and add the quotient may proportional part to the preceding logarithm.

If the given quantity is a cosine, cotangent, or cosecant, the proportional part for the seconds must be subtracted from the logarithm for the degrees and minutes.

#### EXAMPLES.

1. Find the logarithmic tangent of 36° 40′ 50″.

Log. tan. 86° 40'	=	9.8718486
Proportional part = $2637 \times \frac{59}{60}$	=	2197
Log. tan. 86° 40′ 50″	===	9.8720683

2. To find the logarithmic cosecant of 58° 20' 24".

Log. cosec. 
$$53^{\circ}$$
 20' =  $10^{\circ}0957589$   
Prop. part =  $940 \times \frac{94}{55}$  =  $-876$   
Log. cosec.  $53^{\circ}$  20' 24" =  $10^{\circ}0957218$ 

The rule depends on this principle: The tabular difference for any logarithm is the difference between it and the next higher, and therefore is the difference corresponding to 60°; hence if D denote the tabular difference, and d the proportional part to be added for the number of seconds n, then

60 | 
$$n = D$$
 |  $d$ , and  $d = \frac{nD}{60}$ 

This supposes the differences to be constant, which is nearly the case for several consecutive logarithms.

#### EXERCISES.

- Find the logarithmic sine of 86° 24′ 36″.
   Find the logarithmic cotangent of 53° 32′ 42″.
   Ans. 9.7784642.
   Ans. 9.8684953.
- (23) TO FIND THE NUMBER OF DEGREES, MINUTES, AND SECONDS CORRESPONDING TO ANY LOGARITHMIO BINE, TANGENT, OR SECANT.
  - (a) When the logarithm is found in the tables.

The number of degrees will be found at the top or foot of the page, according the name of the logarithm is at the top or foot of the column, and the minutes to and in the proper column. In in (22).

1 The log tan. | \$673,83 corresponds to \$6° 23.

2 The log cos. # 7776128 corresponds # 53° 11'.

(6) When the given logarithm is mill found in the table exactly

Find the  $\blacksquare \blacksquare \blacksquare$  lower logarithm in the proper column, and take the degrees and manutes corresponding to it when  $\blacksquare$  is  $\blacksquare$  use, tangent,  $\blacksquare$  sceant, find the difference between this logarithm and the given one, multiply this difference by 60 and divide by the stabilar difference, and the quotient will  $\blacksquare$  the number of seconds required

(c) When the given logarithm is that of a counce, cotangent, ≡ cosecant, ≡ u ≡ be taken from the next higher logarithm ≡ the table, and the seconds found from the remarker ≡ above

#### PTAMPLES.

1 Find the degrees, minutes, and seconds corresponding to the logarithmic sine 9 9047423

Next lower 9-9047106 = log sine 58" 25"

Given log #9047423

Difference a 817, and tab diff. = 937.

Hence  $n = \frac{817 \times 60}{937} = 30' \text{ 8}$ and  $9 \cdot 9047423 = \log \text{ since } 63^{\circ} 25 \cdot 20' \text{ 8}$ 

2 Find the number of degrees minutes, and seconds corresponding to the locarithmic cosecant 10:2230452

Next higher  $10.2281850 = \log \csc.86^{\circ} 15'$ 

Given log 10 2280452

Difference 1898, and tab. diff. = 1723

Hence  $n = \frac{1898 \times 60}{1722} = 48 \ 7$ 

and 10 2280452 = log casec, 26° 15 48 °7

The rule depends on the proportion = article 22, =

 $D d = 60 s and s = \frac{60d}{T}$ 

#### EXERCISES

1 Find the degrees, &c. corresponding = the logarithmic tangent # 8644658.

Ans 86° 12 4" 6.

2 Find the degrees, &c. corresponding ≡ the logarithmic cotangent 9 8734-23 Ans 53 13 55".

#### RULES FOR SMALL ARCS.

(24) It should be noted that both the logarithms and the natural meet and conceants of angles sme 50° vary slowly and usarily regularly, and that, while the logarithms comes and secants of such angles vary ray dly and irregularly, their natural comes and secants vary ray thy but nearly regularly. It there fore follows that both the logarithm c and natural tangents and cotangents of angles near 90° vary rapidly and irregularly.

On the other hand, in the case of small angles, the natural and logarithmic cosines vary slowly and regularly, the logarithmic sines vary rapidly and irregularly, while the natural sines vary rapidly and regularly.

Hence in trigonometrical equations where exactitude of solution is desired, a sine formula should not be used if the answer or root is an angle of near 90°; while if the answer is a small angle, a cosine formula should not be used.

It is evident from the above that when dealing with small angles, say, under 3°, containing fractional portions of a minute, ordinary interpolation by proportional parts will not give exact results, and one or other of the following rules must be used:

## (25) TO FIND THE LOGARITHMIC SINE OF A SMALL ARC.

To the logarithm of the arc reduced to seconds add 4°CS55749, and from the sum subtract one-third of its logarithmic secant, the index of the latter logarithm being previously diminished by 10; the remainder is the required logarithmic sine.

### EXAMPLE.

Find the logarithmic sine of 1° 44′ 36".8.

This may also be determined by the use of natural sines, thus:

Hence log. sine 1° 44′ 36″ 8 = log. 0.0304261 = 2.4832463

## (26) TO FIND THE LOGARITHMIC TANGENT OF A SMALL ARC.

To the logarithm of the arc reduced to seconds add 4.6855749, and two-thirds of the logarithmic secant, the index of the latter logarithm being previously diminished by 10; the sum is the required logarithmic tangent.

## EXAMPLE.

Find the logarithmic tangent of 1° 44′ 36″ 8.  $= 1^{\circ}$  44′ 36″ 8 = 6276″ 8, and its log.

Constant number =  $\frac{4 \cdot 6855749}{8 \cdot 4833132}$   $+ \frac{4}{3}$  (Log. sec.  $\alpha - 10$ ) =  $\frac{1}{3} \times 0002011$  =  $\frac{1}{3} \times 0002011$ Hence log. tangent of 1° 44′ 36″ 8 =  $\frac{1}{3} \times 4834473$ 

m the

۱

## (27) To give a small are in the locality are

To the given logarithmic sine add # 314251 and one third of the sponding logarithmic secant, the index of the latter logarithm being previously dimmashed by 10, the = 13 the logarithm of the number of seconds

#### KXAMPLE

Find the are corresponding to the logarithmic = 8 4832462

The arc = found in the ordinary way to be 1° 44 36 , and the logarithmic secant of this == is 10 0002011 hence

Given log sine	The	8 4832462
Constant number	==	# 3144251
4 (Log sec 10)	=	0 0000670
\$ 6976 B	_	3 7977383

(28) To small arc or the Logarithmic training is

To the given logarithmic tangent add 5 3144251 and from this sum subtract two thirds of the corresponding logarithmic secant previously diminishing its index by 10, the remainder is the logarithm of the number of seconds = the are

#### RYAMPLE

The logarithmic tangent of m small are is 8 4834473, required the arc It is found in the usual way that the arc is nearly 1° 44 36, and its log secant = 10 0002011

Given log tangent	=	8 4834473
Constant number	=	5 3144251
		3 7978721
-{ (Log sec 10)	-	0 0001341
L 6276 8	==	3 7977383
	_	

Hence a = 6276 8 = 1° 44 36 ■

## CIRCULAR MEASURE OF ANGLES OR RADIANS ARCS TO RADIUS = | (Pages | 239)

(33) TO FIND CIPCULAR MEASURE OF AN ARC THE ANGULAR MEASURE WHICH CIVEN, AND CONVERSALY

(a) Find the degrees in the are at the top of the page and the minutes at the left-hand srd then under the degrees and opposite the minutes at the left hought but if the angle contain seconds to this result add the number opposite the seconds at the right hand side of the page and the sum will be the length sought

(b) Conversely When the length m circular measure is given find the given kingth in the table, then the degrees at the top and the

minutes at the left-hand side give the angular measure sought when the length is found in the table exactly; but if the length is not found exactly in the table, take the degrees and minutes corresponding to the next less are, and subtract this next less are from the given one, and opposite the remainder on the right-hand side of the page will be found the seconds in the are.

This table provides a rapid and exact means of converting angles from circular measure to degrees, minutes, and seconds, and conversely.

It is obvious that the parts for seconds of arc, tabulated at the right-hand side of the pages, are uniformly applicable to any angle, irrespective of its magnitude.

The table is specially useful in railway surveying, because the length of any circular curve can be found almost by inspection, if the radius

and the central angle | be given.

#### EVAMPLE.

The angle of deviation formed by two straights of a railway is 10° 50′ 20″. The straights are to be connected by a curve of radius 4000 feet. What is the length of the curve?

 Circular measure of 10° 50′
 = 0.1890773 

 Difference for 20″
 = 0.0000970 

 Radius
 = 4000 

 Length of curve
 = 756.7 feet

# NATURAL SINES, COSINES, VERSED SINES, AND CHORDS. (Pages 240-284.)

(34) The natural sines, cosines, versed sines, chords, &c., contained in this table, are the lengths of these functions of arcs of ■ circle whose radius≈1. They are all decimal fractions, though the point is not prefixed except where they are equal to or greater than 1, in which case the point is inserted. Or, they are the lengths of the same functions, in integers, to radius = 10,000,000.

The natural sines and cosines of arcs, also the arcs for any given natural sines or cosines, are found from the table by the same method as that used for logarithmic sines and cosines.

The natural sines and cosines of arcs are easily found from the logarithmic sines and cosines, by merely subtracting 10 from the indices of the latter, and then the number corresponding to this logarithm is the natural sine or cosine required. In the same manner the natural tangents, secants, &c. can be found.

Let s = the natural sine of an arc, and S = the sine of the same arc, whose logarithm is the logarithmic sine: then S = 10,000,000,000 s and LS = 10 + Ls or Ls = LS - 10.

#### WYAMPI.E

Given the logarithmic ains = 44', namely, 9 7767676, to find the natural sine of the same arc.

| L sine 36\* 44\* | = 17767676 | Subtract | 10 | L nst sine | 17767676 | Hence natural sine | = 5980015

If the chord of  $\blacksquare$  are greater than 90° be required, take twice the natural  $\blacksquare$  of half that are, and  $\blacksquare$  will be the chord required Or, let e=the chord of its supplement, then the square root of (2+e) (2-e) =the required chord, is the chord sought= $\sqrt{4-e^2}$ 

Note—This table we be used for finding the length of a degree of longitude corresponding to any given latitude; thus, multiply the natural coams of the given latitude by 60, and the product will be the length of a degree of longitude in geographical or manifical miles; we multiply the week by 63 l21, and the product will be the length in English miles, the earth bong considered we septem of radius 3000 miles.

The table of chords is convenient for finding the lengths of the chords required in setting out railway and other curves

#### EXAMPLE

What is the chordal distance between two points 250 ft apart along a curve of 700 ft radius?

 $\theta$ , the central angle, is  $\frac{250}{700}$ , or 0 3571, which, by table, p 251, is 20° 27' 30°, the chord of which, by table, is 0 3551 0 3551  $\approx$  700  $\approx$  218 57 ft the chord of length reconsed

The table of chords me also useful in setting out angles, either on paper, me in the field by chane only. The versions are useful in reducing channess taken on the slope, with a 'long' me 'compound' chan, to their horizontal equivalents

#### EXAMPLE.

Find the horizontal equivalent of 463 7 ft measured as alope of 3 46.

Housental correction = 463 7 (1 - con 3° 46) = == 7 × versine 3° 46' = 463 7 × 0.002 = 0.9

Therefore horizontal distance=462 8 ft.

#### NATURAL TANGENTS AND COTANGENTS, SECANTS AND COSECANTS (Pages 285-310)

(35) This table is used in the manuer in the table of natural sines and cosines, namely, the degrees are found at the top of the page,

and the minutes of the angle at the left-hand side of the page, when the quantity sought is a tangent or secant; but the degrees must be found at the bottom of the page, and the minutes at the right-hand side of the page, when the quantity sought is a cotangent or cosecant; the quantity sought will then be found at the angle of intersection of these columns, or it is the only quantity which is common to both columns.

If the given angle contain seconds, find the difference between the quantity corresponding to the minutes in the given angle, and that corresponding to the next higher minute, which will give the change for 1' = 60'', which call D, and let d be the correction corresponding to the seconds in the given angle, which call s; then

$$60'' : s'' :: D : d$$

$$. \cdot . d = \frac{s D}{60} = \text{the correction sought.}$$

This correction must be applied by addition if the quantity sought be a tangent or secant, but by subtraction if it be a cotangent or cosecant.

If the angle be sought which corresponds to a given tangent or secant, sotangent or cosecant, find the next less, if it be not found exactly in the table, when the given quantity is a tangent or secant, but the next greater when it is a cotangent or cosecant, and take the difference between it and the given quantity, which call d; also take the difference between this tabular quantity and that corresponding to the next higher minute, which call D; then

D: 
$$d:: 60'': m$$
 (the seconds sought), 
$$: s = \frac{60 \ d}{D}$$

#### EXAMPLE I.

Find the natural tangent of 42° 17' 43".

Natural tangent of 
$$42^{\circ}$$
 17' = .9003984 + .9099300  
Difference for  $60'' = D$  = .5316  
 $d = \frac{43 \text{ D}}{60} = \frac{43 \times 5316}{60}$  = .3810 + .9097794

## EXAMPLE IL

Find the natural cotangent of 42° 17' 43".

Natural cotangent of 42° 17' = 1.0996281+

" = 42° 18' = 1.0999857

Difference for 
$$60''=D$$
 =  $6424$ 
 $d = \frac{43}{60} = \frac{43 \times 6424}{60} = 4604 - \frac{4604}{60}$ 

.\*. natural cotangent 42° 17' 43'' = 1.0991677

#### EXAMPLE III

Find the angle whose natural tangent is 7342856.

Given natural tangent		7342856
Natural tangent 36° 17'	==	7341253
. d	=	1603
Also natural tangent 36° 18°	Bu	7345730
	-	4477

But  $s = \frac{60 \text{ d}}{D} = \frac{60 \times 1603}{4477} = \frac{96180}{4477} = 21'' 5$ 

Hence 7342So6=natural tangent of 36" 17 21 #

#### EXAMPLE IV

Find the angle whose natural cotangent is 2 1583764

But  $s = \frac{60 \times d}{D} = \frac{60 \times 8712}{10401} = \frac{592720}{16461} = 31^{\circ}$  ||

Hence 2 1583761 = pateral cotangent of 24° 51° 31 ||

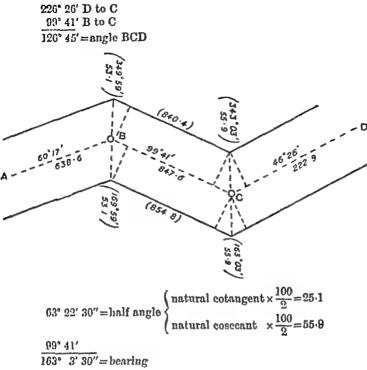

(33) The calculations for the secants and cosecants, where the angle involves seconds, in the same in those given above for tangents and cotangents.

These tables are specially useful in setting out the angle points, and in inding the lengths of the addes of parallel sided strips of land, such in road or railway reserves, which in newly cettled countries are generally of uniform widths of some even integer of chause, or feet.

#### RYAMPLE

The whole circle bearings and the dustances along the centre lines of pirt of a road reserve 100 ft wide mm. At D. 60° 17, 638 B, B to C, 50° 41, 847 S, C to D, 65° 26, 222° 9 What are the respective bearings and distances from H and C to the angle points of the road and what are the lengths of those sides of the road which are parallel to BO? 20° 17 B to A.

189° 59 is the man of the half angle and the bearing of BC, and is the bearing of the line from in to the soudside angle point.

(Check: 163° 3′ 30"+63° 22′ 30"=226° 26′.)

The bearings and distances from B to the angle points, are 349° 59', 53-1

169° 59′, 53·1

and the similar bearings and distances from C are 343° 3′ 30″, 55.9 163° 3′ 30″, 55.9

The northern roadside parallel to BC is 847.6 + 17.9 - 25.1 = 840.4

The southern roadside parallel to BC is

847.6 - 17.9 + 25.1 = 854.8
